MASTER SUMMARY: Bull Run Millions Crypto Course Trading Playbook

Course Philosophy

Crypto markets are zero-sum (negative-sum once exchange fees are included): every dollar made is a dollar someone else lost. The only exception is the "exit liquidity" phase at the peak of a bull run, when new retail participants flood in and experienced holders can all profit simultaneously at the expense of the late arrivals. The instructor frames the entire course around this dynamic: surviving and accumulating during bear markets (PVP — player vs. player), then positioning early into asymmetric opportunities, and finally selling to the incoming wave of normies (PVE — player vs. enemy) before the cycle ends.

Markets repeat because humans repeat the same cognitive and emotional mistakes every four years. Profitable investing means recognizing those biases in yourself and doing the opposite of what instinct demands. The highest edge available to an independent investor is not information — it is emotional discipline combined with second- and third-order thinking that arrives at a thesis before the broader market understands it.

The core investment model is: use fundamental analysis to find small coins (5–100M market cap) with 10–100x potential, buy them during peak fear when perception is worse than reality, hold a concentrated portfolio of three to seven positions for the duration of a bull run thesis, and sell when the thesis plays out — i.e., when your intended exit liquidity (late retail) arrives. Tax and banking infrastructure to handle seven-figure outcomes is treated as an integral part of this plan, not an afterthought.

The course is described as a jigsaw puzzle — no single section is complete without the whole. Students are not given a recipe; they are taught first principles so they become independent analysts ("chefs") rather than followers.

The Strategy in Brief

"Find and spot 10–100x opportunities, buy them low using a hands-off strategy, hold them through the course of a bull run, and then exit near the top."

More specifically: use fundamental analysis to identify new coins (under 12 months old, fair launch preferred, 5–100M market cap) whose perception is significantly worse than their reality, buy during peak fear when crypto Twitter has forgotten the coin and upside is asymmetric, hold a maximum of seven liquid positions (two to three long-term multi-cycle holds plus three to five shorter-cycle altcoins), and sell when the thesis plays out — when "your once third-order consequences become the market's front-facing reality" and the retail/normie wave arrives to be your exit liquidity. Earlier in the bull run, take on risk; later in the bull run, take it off.

Master Rules (from all sections)

On process and strategy:

- Watch the course in order; do not skip sections — "the order exists for a reason." [from Introduction]
- Understand first principles rather than following a recipe: "I'm going to turn you into a chef... I'm going to teach you the first principles of the raw ingredients." [from Introduction]

- "You have to follow a process. You have to have a strategy. You have to have a defined edge... You follow the logic, not the emotions." [from Mindset]
- "It's not about the coin, it's about the portfolio, the process, the thesis and the consideration of downside upfront." [from Do-Not-Do List]
- "The coin isn't actually the really important component of the strategy, it's everything else around it." [from Building a Strategy Edge]
- "Buying the dip is not a strategy" — a strategy requires predefined criteria for entry and exit. [from Building a Strategy Edge]
- "You either follow the pro or become the pro. Anything outside of this is just gonna lead to losing money." [from Building a Strategy Edge]
- "If you're gonna follow the pro, you have to do everything they say. Everything or nothing." [from Building a Strategy Edge]
- "There is no part-time profitable trader. You either dedicate your life to it or you avoid it completely." [from Building a Strategy Edge]

On market dynamics:

- "You don't make money in crypto... You take money. You're taking other people's money." [from Mindset]
- "During PVP [bear market], you want to survive. You're not trying to get rich here." [from Mindset]
- "Your goal during exit liquidity is to be smart enough... to take on risk, and then it is to exit." Sell to the "normies." [from Mindset]
- "The goal is not to buy the bottom or sell the top... The goal is to capture six-eighths of the trend." [from Mindset]
- "You become rich by concentrating on something, and you stay rich by diversifying." Apply concentration when building wealth in crypto. [from Crypto Cycles]
- "Earlier in the bull run, you take on the risk. Later in the bull run, you take off the risk." [from Crypto Cycles]
- "The goal is you identify cognitive biases and you recognize them when you feel them for yourself and you ignore them and you act against them. That's how you make money in markets." [from Market Psychology]
- "In markets you get paid for doing the opposite of what your instincts tell you to do." [from Market Psychology]
- Contrarian positioning only works at extremes — "in the middle of the trend, the trend is your friend." Do not counter-trade the middle of a bull market. [from Market Psychology]
- "You cannot come to the market and expect the price to be a reflection of anything fair. The price is simply a representation of what humans are thinking, feeling, and seeing, and anticipating to happen in the future." [from Market Psychology]
- "The market can remain irrational longer than you can remain solvent." [from Market Psychology]
- "Every seller is usually a future buyer" — at the bottom, all sellers have moved to cash and will eventually want to buy back. [from Market Psychology]

On buying:

- "You need to retrain your brain to buy when it hurts and sell when it hurts." [from Mindset]
- "Buying fear is scary upfront and peaceful later. Buying greed is easy upfront and scary later." [from Mindset, Do-Not-Do List]
- "You have to go internal to external" in your research — form your own thesis first, then seek external input. [from Mindset]
- Maximum of seven coins in a liquid portfolio at any time (two to three long-term holds plus three to five altcoin positions). [from Crypto Cycles]

- Only hold a new altcoin for a maximum of one bull cycle. "Buy a low, new altcoin, capture its first bull cycle, and then sell it to compound your long-term holds." [from Crypto Cycles]
- Do not buy a coin immediately after finding it and liking it — wait for an asymmetric entry. [from Crypto Cycles]
- Do not mix strategies. Long-term investors must buy during fear and sell during greed; if you enter a sector late via momentum but hold as a long-term investor, you will lose money. [from Crypto Cycles, Do-Not-Do List]
- "The only way to buy low in the green zone and sell in the red zone is to ignore emotions and listen to logic." [from Do-Not-Do List]
- "You can only buy in this green box" (the early, fearful phase of the cycle) for long-term investing. [from Do-Not-Do List]
- "Before I enter a trade I ask myself who's my exit liquidity. If I can't identify a group of people to be my exit liquidity, it's probably me." [from Fundamental Analysis]
- You must separate finding a coin from buying a coin. "A coin is only good when its perception is worse than its reality." [from Fundamental Analysis]
- "The harder it is to buy a coin, the more likely it is mispriced as it becomes easier to buy over time." [from Fundamental Analysis]
- "If you tell everyone there's this new primitive no one knows about and they ignore you and think you're an idiot, you're in a great place." Buy what is unknown, sell when it is known. [from Fundamental Analysis]
- Do not buy old coins. "Avoiding old dino coins is one of the most important rules for maximizing your returns in bull runs." [from Fundamental Analysis]

On selling and exits:

- "Selling tops is way harder than buying bottoms." Toward the later stages of a bull run, ask daily: "Do I think this is the final eighth of the bull run?" When the answer is yes, begin the exit strategy. [from Mindset]
- "You should always assume your portfolio is 30% less than it is" because you will never sell the exact top. For volatile altcoins, assume the position is worth 50% less. [from Mindset]
- "Selling a top has a 98% plus failure rate." [from Mindset]
- "The three times you sell: you were right, you were wrong, you found something better." [from Do-Not-Do List]
- Do not use a stop loss on long-term investments — "the stop loss is your thesis invalidation." [from Do-Not-Do List, Fundamental Analysis, Technical Analysis]
- "In investing you don't use a stop loss, you use a thesis instead. The invalidation of a thesis is your stop loss." [from Fundamental Analysis]
- "Translate your emotional feeling of conviction into a thesis so that it can be tracked but also invalidated." [from Fundamental Analysis]
- "You need to sell when your once third order consequences become the market's front-facing reality." [from Fundamental Analysis]
- When doing momentum trading, you must use a stop loss because you are buying high and asymmetric downside exists. [from Do-Not-Do List]
- Add to your winners, cut your losers. Do not sell winning positions to chase coins that have not yet moved. [from Crypto Cycles]
- "Let your winners run and cut your losers." [from Do-Not-Do List]
- "Winners tend to keep winning" — do not cut a winning position early with an arbitrary rule. [from Do-Not-Do List]
- "The big money is not made in the individual fluctuations but in the main movement." [from Do-Not-Do List]

On risk and position sizing:

- "Decrease your position size so that you're not gonna end up making emotional decisions due to the increased emotion of really caring about the money." [from Mindset]
- "10% of your decisions will bring you 90% of your profits." Wait; do nothing most of the time. "In investing, the right thing to do is almost always nothing." [from Mindset]
- "Your goal is to position early into an asset's uptrend so that temporary downside volatility eats into profits, not initial capital." [from Mindset]
- Never increase position sizing simply because your portfolio has grown. "If your position sizing increases as you profit later in the bull, you're doomed to lose all your money when the market hits its top." [from Crypto Cycles]
- "All good risk management strategy does is just cut out the big loss." [from Building a Strategy Edge]
- "Your ability to make money comes down to your ability to cut your losers early and let your winners run." [from Do-Not-Do List]

On leverage:

- "Don't use leverage — stick to spot." [from Mindset]
- Do not use leverage trading unless you are a top-1% market analyst who can identify the Big Long early. "Leverage trading is a pursuit that has a 99.9% failure rate." [from Crypto Cycles]
- Leverage "allows you to trade with less money" — that is the correct mindset. Using leverage to trade with more money than you otherwise would is the wrong approach. [from Scams to Avoid]

On yield:

- Focus exclusively on delta (price appreciation), not yield. "100% capital risk to make 5-20% never makes sense." [from Mindset]
- "Passive income in general, I recommend staying away from in crypto. It's not asymmetric in nature." [from Scams to Avoid]
- "If the yield is high, always consider what underlying risks are associated." [from Scams to Avoid]
- Distinguish real yield (paid from actual platform usage) from fake yield (paid from token inflation) before deploying capital. [from Scams to Avoid]

On tuition and learning:

- "There is a minimum amount of losses, a minimum amount of pain, a minimum amount of mistakes that you must make, over a minimum amount of time, before you can keep all of the money that you're making." The typical tuition period is one full market cycle of three to four years. [from Mindset]
- "Make as many mistakes as possible with the least amount of loss per mistake." [from Mindset]
- "You cannot experience a lesson from learning it from someone else and expect to avoid that mistake. Every mistake must be made from first hand experience in trading." [from Building a Strategy Edge]
- When you make a mistake, ask: "What went wrong in my system and how can I stop this from ever happening again?" [from Mindset, Market Psychology]

On charts and technical analysis:

- "The less you can use charts, I think, the better" as an investor. [from Technical Analysis]
- "Not all lines are made equal. Not every line has the same value." [from Technical Analysis]
- Support and resistance lines are drawn where candle bodies close, not where wicks extend, on the 4-hour and daily timeframes. [from Technical Analysis]
- "Each additional tap [of a support level] is a sign of weakness." [from Technical Analysis]
- "You want to see volume come in on the breakout and then you want to be buying in on the retest." [from Technical Analysis]

- For the hunter algorithm buy signal: "When funding is negative and price is below the green line, we look to buy." [from Technical Analysis]
- "Funding data is the only data set which doesn't suffer from alpha decay." [from Building a Strategy Edge]

On taxes:

- "Every time you buy and sell a position it's considered a taxable event" — including swaps between crypto assets. [from Taxes and Banking]
- "For most of you, you're going to need to buy and hold for at least a year" to benefit from 0% crypto tax treatment in applicable countries. [from Taxes and Banking]
- "If your country has a departure or an exit tax you need to be looking at leaving now." [from Taxes and Banking]
- "The most secure setups involve someone living in one place with low taxes for the majority of the year as there's little space for judgment or interpretation." [from Taxes and Banking]

Entry Signals & Conditions

Sentiment-based signals:

- Buy when sentiment is at its worst and the most people hate a coin: "the best time to buy is when no one wants to buy." Look for the point where "there's no one left to hate, there's no one left to sell, there's no more bad news to come." [from Market Psychology]
- Enter a position "when the upside is asymmetric" and "when the coin is not a consensus bet / majority aren't interested." [from Mindset]
- "Your best investments will be the hardest to buy in the moment." If buying feels easy or comfortable, the upside is likely not sufficiently asymmetric. [from Mindset]
- Buy when crypto Twitter has forgotten about the coin and there is fear among holders. [from Crypto Cycles]
- Negative funding rate (crowd is overly short/bearish) historically coincides with market bottoms and is a signal to consider buying. Positive funding (crowd is overly long/bullish) historically coincides with tops and is a signal to consider selling. [from Crypto Cycles]

Fundamental entry signals:

- Outlier price action — a coin that does not go down when the rest of the market dumps, or goes up while Bitcoin makes lower lows. "If bitcoin dropping 10% in a day can't make a coin go down, what will?" Described as "one of the highest hit-rate setups in crypto." [from Fundamental Analysis]
- Bad news + price not going down — bearish news that fails to move price signals bad news is priced in and underlying strength exists. [from Fundamental Analysis]
- Perception significantly worse than reality — buy when the perceived value is materially lower than assessed reality. [from Fundamental Analysis]
- New coins on small exchanges (MEXC, ExBitX, KuCoin, SafeTrade) — new layer 1 and AI coins listed on smaller exchanges first; screen for outlier price action in early months. [from Fundamental Analysis]
- CoinGecko top gainers during market dumps — screening top gainers in the top 1,000 coins during a broad selloff identifies coins with relative strength. [from Fundamental Analysis]
- Zero-to-one primitives in their first or second iteration — the first good iteration of a genuinely new technology or sector. [from Fundamental Analysis]
- Strong community + outlier price action + fair launch + new coin (under 12 months, no prior bull cycle). [from Fundamental Analysis]

Technical entry signals:

- Breakout and retest: price breaks above a key resistance level on high volume, then retests that level as support. Buy on the retest. [from Technical Analysis]
- Sizable dip / retracement buy after a coin has pulled back by its historically typical percentage:
  - Bitcoin: ~20% pullback in a bull market [from Technical Analysis]
  - Ethereum: ~25% pullback in a bull market [from Technical Analysis]
  - Solana: ~30–50% pullback in a bull market [from Technical Analysis]
  - Meme coins: ~40–60% pullback in a bull market (sometimes 70%) [from Technical Analysis]
- Bear market accumulation: wait for altcoins to decline 80–90% before looking for entries. [from Technical Analysis]
- Capitulation buy (confluence of): hunter algorithm buy signal (negative funding + price below moving average), realized losses deeply negative, large long liquidations, spike in bid depth showing smart money accumulating, high DEX volume spikes, highly negative aggregate funding rates. All tools must be used together. [from Technical Analysis]

For the Big Long (early bull, limited to top-tier analysts):

- Enter after a key breakout from an accumulation region, then wait for a retest of a significant level ("dark green" zone). This only applies early in the bull run. [from Crypto Cycles]

Hunter algorithm (long-term investing system):

- Buy signal requires simultaneously: (1) price below a specific moving average AND (2) negative funding data. Wait 10–15 seconds after the daily candle open before acting. Additional confluence datasets checked after the signal determine confidence level and position size. [from Building a Strategy Edge]

Pre-announcement positioning:

- Buy before a major announcement, not after. Smart investors buy in anticipation of news and sell "three to seven days before the announcement comes out." [from Market Psychology]

Position Sizing & Risk Management

Portfolio structure:

- Maximum of seven liquid positions: two to three long-term multi-cycle holds plus three to five shorter-cycle altcoin positions. [from Crypto Cycles]
- Concentrated bets: "There's only 2 to 3 really really good high conviction bets" at any time. [from Do-Not-Do List]
- Capital allocation by portfolio size [from Building a Strategy Edge]:
  - Under $2,000: focus entirely on airdrops and sub-$100M market cap coins with 20x potential.
  - $2,000–$15,000: same focus, with free money opportunities added.
  - $15,000–$50,000: half in high-upside altcoins, with presales and free money opportunities.
  - $15,000–$200,000: drop manual airdrop farming, focus on presales and long-term investments.
  - Over $200,000: barbell strategy (mostly safe/major assets, 10–30% high-upside smaller projects); no manual airdrop farming.

Sizing and adding:

- Size positions to a level where a 50% loss would not cause you to act emotionally. [from Mindset]

- Position sizing is influenced by the level of confluence at the time of a signal — more confirming data points warrant a larger position. [from Building a Strategy Edge]
- Never increase position sizing as the portfolio grows later in the bull run. [from Crypto Cycles]
- Do not add more capital to the market as the bull run progresses — "you should be reducing your risk, not increasing it." [from Do-Not-Do List]
- "You always want to have a little bit more than what feels comfortable" in terms of position size — meaningful but not so large it creates emotional decisions. [from Do-Not-Do List]

Exits and stop losses:

- The invalidation of the thesis is the stop loss — not a price level or percentage. [from Fundamental Analysis, Technical Analysis, Building a Strategy Edge]
- Sell when: (1) the thesis plays out, (2) the thesis is invalidated, or (3) a clearly better opportunity exists. [from Do-Not-Do List]
- Sell when your intended exit liquidity (late retail / normies) arrives — triggered by the arrival of the target buyer demographic, not a price. [from Fundamental Analysis]
- Do not sell half on a 2x — described as "one of the dumbest strategies" that cuts winners early and violates the asymmetric return model. [from Do-Not-Do List]
- Selling and re-buying increases decisions (each added decision is added risk), taxes, and the risk of being forced into laggards. [from Do-Not-Do List]

Expected return ranges (for calibrating when to reduce risk):

- Bitcoin: 4–8x from cycle bottom to top [from Technical Analysis]
- Ethereum: similar to Bitcoin, slightly more [from Technical Analysis]
- Solana: 15–30x from cycle bottom to top [from Technical Analysis]
- Meme coins: 10–100x from cycle bottom to top [from Technical Analysis]

During bear markets:

- Capital preservation is the explicit priority. "When the market is in a bear market, the key is to preserve your capital." Losing 80% during a bear market means 80% less capital to deploy in the next opportunity. [from Crypto Cycles]
- Reduce leverage and overall risk exposure as the bull run matures. During the final phase, move predominantly into stablecoins. [from Crypto Cycles]

Yield / risk-reward framing:

- "You want to be making 10 reward for every [1 risk]" as a general principle. [from Scams to Avoid]
- Yield farming risk-reward: "you potentially lose 100% if something goes wrong and make what, 20%, 50% — so your risk to reward is 0.5 risk for one reward... that's a bad ratio." [from Scams to Avoid]

Tax-aware holding:

- Holding fewer positions for as long as possible is better from a tax compounding perspective. [from Taxes and Banking]
- In Australia: holding under one year triggers short-term capital gains tax significantly higher than long-term capital gains tax for positions held over one year. [from Do-Not-Do List]

What NOT To Do (Do-Not-Do List)

On leverage:

- Do not use high leverage: "a lot of you are gonna have to get liquidated with leverage... 100x leverage... just dumb." [from Introduction]
- Do not use leverage trading unless you are a top-1% market analyst. "Leverage trading is a pursuit that has a 99.9% failure rate." [from Crypto Cycles]
- Do not use leverage to trade a larger position than you could otherwise afford — that is the wrong mindset. [from Scams to Avoid]

On emotions and behavior:

- Do not HODL shitcoins: "The hodl meme that you see online is bullshit. Outside of maybe Bitcoin, you shouldn't be trying to implement something related to hodl because every shitcoin's end destination is minus 99%." [from Mindset]
- Do not ask for or rely on price predictions: "Stop asking for price predictions. They don't work." [from Mindset]
- Do not try to sell the exact top: "Selling a top has a 98% plus failure rate." [from Mindset]
- Do not sell a position during a bull market just to mitigate short-term volatility while you believe the long-term thesis remains intact. [from Mindset]
- Do not use confirmation bias to justify holding a losing position. [from Market Psychology]
- Do not add a coin's name or branding to your identity: "it makes that a part of your identity. It's harder to think critically... you need to be fluid and you need to not attach your identity to any particular coin." [from Market Psychology]
- Do not use hindsight bias as a source of false competence. [from Market Psychology]
- Do not ignore negative news on a project you are holding. [from Market Psychology]
- Do not buy when it feels good and confident — "trying to enter when you had confidence is what f***** you up." [from Market Psychology]
- Do not over-participate in the market — every additional transaction or reaction to noise increases the chance of being shaken out. [from Market Psychology]
- Do not look at charts all day: "Looking at charts all day is just gonna make you less money. You make the most money by doing nothing." [from Do-Not-Do List]
- Do not make emotional decisions instead of process-based decisions. [from Building a Strategy Edge]

On influencers and social media:

- Do not buy a coin simply because it appeared on Twitter or a YouTube influencer discussed it: "If you've found the coin that you want to buy from Twitter, you've already f***ed up." [from Mindset]
- Do not copy random influencers on Twitter: "Random dudes on Twitter tell you when they buy but they never tell you when they sell." [from Mindset]
- Do not copy your favourite Twitter influencer or YouTube guru for coin picks: "Copying your favourite crypto guru on social media" is not a viable strategy. "Your influencer's exit liquidity. Literally." [from Do-Not-Do List]
- Do not follow too many people at once — conflicting signals from different strategies produce losses. [from Building a Strategy Edge]
- Do not copy traders: "You cannot make money long-term copying traders." Time-sensitive entries and exits mean a follower will consistently exit later with less profit. [from Building a Strategy Edge]
- Do not base your thesis on what the market already knows — publicly available information has already been priced in. [from Fundamental Analysis]

On coin selection:

- Do not buy old coins (Cardano, Ripple, Litecoin, Mana, Curve, Decentraland): "these coins are a must, must, must avoid." [from Fundamental Analysis]

- Do not buy VC coins without understanding the extraction game: "Most VC coins die off after 6–18 months." [from Fundamental Analysis]
- Do not buy a coin just because the team is great or the technology is good — good tech with no narrative, flows, or community does not perform. [from Fundamental Analysis]
- Do not confuse finding a coin with buying a coin — most people buy when they find a coin, which is when it has already pumped. [from Fundamental Analysis]
- Do not invest in governance tokens: "A governance token doesn't do shit... there's no value behind a governance token." [from Fundamental Analysis]
- Do not spend time reading white papers: "White papers — oh, couldn't imagine a worse use of time than reading white papers." [from Fundamental Analysis]
- Do not do level-1 fundamental analysis (copying the project's own website copy, focusing on tech, partnerships, road maps, team credentials). [from Fundamental Analysis]
- Do not hold altcoins long-term: "99% of altcoins actually go up less than bitcoin... you can't really hold altcoins for the long term." [from Fundamental Analysis]
- Do not hold coins where the community has been destroyed by a 90–95% price decline without a demonstrably exceptional community. [from Fundamental Analysis]

On strategies and systems:

- Do not mix strategies — entering with momentum logic and holding with long-term logic is "a surefire sign of a lack of strategy." [from Do-Not-Do List, Crypto Cycles]
- Do not sell half on a 2x: "The key to being a profitable investor is to let your winners run, and cut your losers. So if you sell half on a double, you've just sold the winner early." [from Do-Not-Do List]
- Do not sell a coin to try to buy it back lower: "it's just not gonna happen." If you own a winning coin, it will not give you a re-entry. [from Do-Not-Do List]
- Do not chase pumps based on emotion: "When you chase a pump, you are making an emotional decision." The worst coins pump last in a bull run. [from Do-Not-Do List]
- Do not increase capital deployed into the market as the bull run matures. [from Do-Not-Do List]
- Do not hold 25+ coins: "Diversification is $10,000 into 50 coins. You're an idiot." [from Crypto Cycles]
- Do not become a trader late in the bull run — "The biggest reason why people lose money in crypto, one of the biggest, is they become traders late in the bull run." [from Crypto Cycles]
- Do not use past cycle price fractals to predict exact future price action: "You can't use the exact specifics of the past cycles to determine the next ones." [from Crypto Cycles]
- Do not sell a winning home run position early to chase a coin that has not yet moved. [from Crypto Cycles]

On technical analysis:

- Do not rely solely on technical analysis as an investor. [from Technical Analysis]
- Do not apply basic support/resistance analysis to Bitcoin or large-cap coins — it does not work reliably. [from Technical Analysis]
- Do not trade weak old coins like Litecoin using technical setups — weak coins produce unreliable patterns. [from Technical Analysis]
- Do not draw too many lines — "A lot of people will do super f****** stupid lines like all the time." [from Technical Analysis]
- Do not use Binance volume data for analysis — it is not accurate. [from Technical Analysis]
- Do not buy a 20% dip on a meme coin as if it is a normal retracement. [from Technical Analysis]
- Do not sell during capitulation events out of fear: "Smart people buy fear. Smart people like us buy capitulation." [from Technical Analysis]
- Do not use capitulation tools in isolation — they must be used together. [from Technical Analysis]

- If a coin spends a very long time at support without going up, that is a sign of weakness, not strength. [from Technical Analysis]

On algorithms and systems:

- Do not trust any algorithm based purely on a back test: "You should never trust a system purely based off its back test." [from Building a Strategy Edge]
- Do not trust an algorithm without forward-tested results. [from Building a Strategy Edge]
- Do not rely on a strategy built on arbitrary back-tested parameters — moving average crossovers are cited as "the least reliable" algorithmic system. [from Building a Strategy Edge]
- Do not focus on finding coins through surface-level dumpster-diving. [from Building a Strategy Edge]

On yield and scams:

- Do not chase high-yield farming opportunities advertising extreme APYs (e.g., 1500% per year) — these are fake yield. [from Scams to Avoid]
- Do not confuse token inflation-based returns with real income. [from Scams to Avoid]
- Do not pay fees to prop firms/funded account programs. [from Scams to Avoid]
- Do not trust prop firms for trading education: "the prop firm doesn't want you all to make money because if you all make money, their business model dies." [from Scams to Avoid]
- "AI does not make you money. AI does not suddenly make your bot make money." [from Scams to Avoid]
- Do not pursue yield farming, staking, or mining as primary strategies: "We're here for delta." [from Building a Strategy Edge]
- Do not chase yield at the expense of capital liquidity — locking money to earn yield prevents optimal exits and exposes to total loss. [from Mindset]

On taxes:

- Do not assume an offshore company structure eliminates taxes if you continue to live in your home country. [from Taxes and Banking]
- Do not rely on a single exchange account or bank. [from Taxes and Banking]
- Do not treat the 183-day rule as a hard cutoff. [from Taxes and Banking]
- Do not move offshore purely for tax reasons: "there is far more to life than just taxes." [from Taxes and Banking]
- Do not rush into an offshore setup without a custom plan: "the worst thing to do is to accidentally commit tax evasion." [from Taxes and Banking]
- Be cautious with Cyprus as a banking jurisdiction: the Cyprus government seized deposits in 2013 — "it's not a really stable place to store your wealth." [from Taxes and Banking]
- Do not move to a low-tax country after making large crypto gains — do it before, to avoid exit taxes and capital gains taxes on already-realised wealth. [from Income Sources]

On income and portfolio psychology:

- Do not rely solely on your crypto portfolio for income — it makes emotional management of the portfolio extremely difficult. [from Income Sources]
- Do not expect a course to make you instantly profitable or to prevent losses. [from Introduction]
- Do not approach crypto as an amateur (no strategy, no edge, emotional decision-making, treating it like a casino): "If you are an amateur in crypto, you will lose all of your money." [from Mindset]

Section-by-Section Quick Reference

01 — Introduction to the Course: Frames the course as a jigsaw puzzle of first principles, not a recipe; the strategy in brief is to find small coins with 10–100x potential, hold three to five concentrated positions through the bull run, and sell near the top. Most actionable takeaway: watch every section in order — skipping any part leaves you with a corner of the puzzle.

02 — The Basics: No transcript content available.

03 — Mindset: Covers the zero-sum nature of crypto markets, the PVP/PVE framework, emotional discipline, tuition payments, and the thesis-based (not price-target-based) approach to investing. Most actionable takeaway: "Buy when it hurts and sell when it hurts" — retrain your brain to do the opposite of what instinct demands, and size positions small enough that you will not make emotional decisions.

04 — Market Psychology: Catalogues the cognitive biases (confirmation bias, bandwagon effect, anchoring, hindsight bias, deprival super-reaction, inconsistency-avoidance, doubt-avoidance) that cause investors to repeat the same mistakes every cycle, and explains how markets are forward-looking and move in the direction that hurts the most participants. Most actionable takeaway: do the opposite of the herd at extremes (tops and bottoms), but follow the trend in the middle; always focus on downside first and mentally simulate 50 what-if scenarios before entering a long-term position.

05 — Understanding Crypto Cycles and Price Action: Explains the four-year cycle, the Big Long, reflexivity, the myth of crypto diversification, sector rotations, and the funding rate as a sentiment tool. Most actionable takeaway: take on maximum calculated risk early in the bull run and reduce it progressively as the run matures; never hold more than seven liquid positions; do not increase position sizing as your portfolio grows.

06 — Do-Not-Do List: A comprehensive list of the most common and costly mistakes made by retail investors, including chasing pumps, mixing strategies, selling half on a 2x, copying influencers, and gaining conviction with rising prices. Most actionable takeaway: "The three times you sell: you were right, you were wrong, you found something better" — every other exit is an emotional error.

07 — Fundamental Analysis: Teaches that crypto is a social/attention game (narratives drive price, not technology), that flows analysis is the most important tool, that new fair-launch coins outperform old VC coins, and that analysis must be second- and third-order to have an edge. Most actionable takeaway: "Before I enter a trade I ask myself who's my exit liquidity. If I can't identify a group of people to be my exit liquidity, it's probably me."

08 — Technical Analysis: Covers chart analysis as a supporting 20% of the investment process; explains support/resistance, volume analysis, retracement-based buying levels, and multi-tool capitulation detection. Most actionable takeaway: use thesis invalidation (not a price-level stop loss) as your exit trigger; buy breakout-and-retests on high volume for small/meme coins, and use capitulation signals (funding rate, realized losses, liquidation data) in confluence for Bitcoin and larger coins.

09 — Building a Strategy Edge: Defines what an edge is, presents the four strategies used by the instructor (Hunter algorithm, presale deal flow, airdrop farming, 100x altcoin investing), and explains why 99.9% of traders fail. Most actionable takeaway: long-term investing (buying 5–100M market cap coins with conviction and holding 6–24 months) is described as "the centrepiece of every single crypto participant's portfolio" and the strategy most accessible to non-full-time participants.

10 — Scams to Avoid: Distinguishes real yield (from actual platform usage) from fake yield (from token inflation), exposes the prop firm business model as misaligned with trader success, and frames all passive income in crypto as non-asymmetric. Most actionable takeaway: avoid yield farming, prop firms, and AI trading bot claims; the asymmetric opportunity in crypto is price appreciation (delta), not yield.

11 — Taxes and Banking Infrastructure: Explains the three taxation systems (citizenship-based, residency-based, territorial), the limits of offshore structures, the tax treatment of crypto swaps as taxable events, and the importance of having multiple exchange accounts and banking options. Most actionable takeaway: if you stand to make multiple six figures in crypto, set up your tax residency in a low-tax jurisdiction before the gains are realised — not after — and establish multiple exchange accounts and off-ramp options before the peak of the bull run.

12 — Putting Everything Together: No content available — this section contains no videos in the course.

13 — Best Online Income Sources to Fund Crypto: Presents high ticket sales (remote closing and appointment setting for online education businesses earning $3,000–$50,000+/month in commissions) as the primary income source to fund a crypto portfolio. Most actionable takeaway: having a steady online income makes crypto portfolio management psychologically easier — "if you lose all your money you're back at square one" without it — and networking (not cold outreach) is the primary strategy to land high ticket sales roles.
